The article about the Situation Analyzer function during the gameplay.

(This article is currently under construction!)

1 Information

Situation Analyzer is an [artificial intelligence](#) help program built into the host stations that can provide general feedback and advice about the situation, based on the currently available strategic and tactical information as well as the environmental circumstances of the player.

2 Overview

Situation Analyzer help program can be accessed at any time by pressing the corresponding button at the bottom of the gameplay screen, or simply by pressing the hotkey (default: F2). Once activated, it will assess the situation of the player with currently available information on the level, and will provide some general advice and suggestions for recommended actions.

This feature is most valuable for providing quick assistance to inexperienced players. However, it can be also useful for experienced players as well, considering that it takes minimal effort to activate it at any time and, depends on the level circumstances, it can potentially pick up some valuable currently available information that may otherwise go unnoticed by the player.
